

Vscene desktop and Chrome browser update

Google has now removed support for NPAPI plugins, which we relied on until recently.

The Vscene Desktop plugin has been re-designed to function in a different way and we are currently working on integrating it into our system.

We hope to have both the PC and the Mac versions available soon.

Our desktop plugin can be used with IE11, Safari, Opera, and the latest Firefox versions, so we hope that most users will have access to one of these in the meantime.

You can test Vscene Desktop either by using a link you have to join a conference, or using our test system [here](#) ^[1]

Revised 25 jan 2016
